August						1-07	2-74
September....						.90	2-86
October.....	MET.O.S. RAIN WATER RETROSPECTIVE - 1954 NOV.				291909		2-07 .17
November....	NOR:	TQ(51) 660710					2-20 .73
December.....	NOV	151 ft = 46 metres.	Date of review	3-7-78		3-49	.05
TOTALS							22'82 18'82

67 The Pycnometer is constructed in the following manner: (a a) Fig II represents the receiver, the surface of which is exactly 100 square inches, & is about an inch and a half deep: from this the rain falls into the tube (b b) through the opening (c): this tube is of such a size that one cubic inch of water occupies about an inch of its length. (d) is a hollow ball of very thin copper, & so light that it, together with the scale (e) (which is here, on account of the figures, delineated twice its proper width) readily floats in the water. The cubic inch, or 254 grains of water, being poured into the receiver raises the scale therefore about one inch; at this part the scale is marked — another cubic inch of water raises it again, at which part it is marked likewise, &c. on till the tube is quite filled. It is evident that each of these divisions is equal to a hundredth part of the surface of the receiver — consequently if any one of them is subdivided into ten degrees, each degree will show exactly, in 1000th parts of an inch, what falls into the receiver.

The water is conveyed by this tube laterally by the cock (f) by which substance the ball is always kept floating. Hence it is nearly as easily moved at the foot of the shower
